Filled map and scatter plot

Filled map:

A filled map in Power BI visualizes data by shading geographical areas like states, countries, or cities with different colours or shades to represent a numerical value.

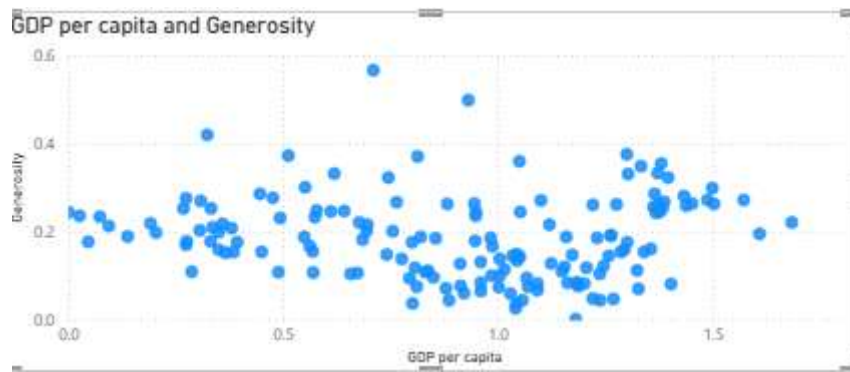

Steps:

1. **Select the visual:** In the Visualizations pane, click the **Filled map** icon. An empty filled map visual will appear on your report canvas.
2. **Add location data:** In the **Fields** pane, find your geographic data (e.g., State, Country, City, Zip Code) and drag it into the **Location** field well of the filled map visual. Power BI will automatically populate the map with the shapes for that location.
3. **Add data for colouring:**
 1. **For a gradient fill:** Drag a numerical measure (e.g., Sales, Profit) into the **Colour saturation** field well. The states will be filled with a colour gradient based on the values of the measure.
 2. **For a categorical fill:** Drag a categorical field (e.g., Region, Department) into the **Legend** field well. The states will be filled with distinct colours based on the categories.
4. **Add tooltips:** Drag any additional fields you want to see when a user hovers over a state into the **Tooltips** field well.

Scatter Plot:

A Power BI scatter chart visualizes the relationship between two numerical variables by plotting points on a horizontal (X) and vertical (Y) axis.

Correlation: -

It means to check the relationship between two numerical columns or values or features we use correlation.

There are three types of correlation:

1. Positive correlation

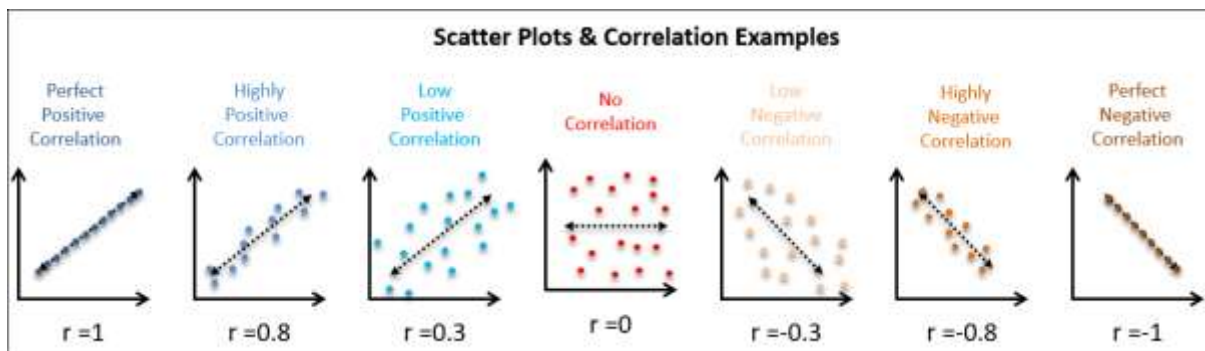

- If x value increases mean y value will also increases

2. Negative correlation

- If x increases Y will decreases or Vice versa

3. No correlation

- There is no any kind of relationship between X and y

Steps:

1. **Select the visual:**

Click on the Scatter chart icon in the Visualizations pane.

2. **Add X and Y axes:**

Drag a numerical field GDP PER CAPITA to the X-Axis field and another numerical field GENOROSITY to the Y-Axis field.
