More Slicers

Understanding Power BI Slicers

Power BI **slicers** are interactive filtering tools that allow users to slice and analyse data dynamically. They act as on-report filters, enabling viewers to refine visuals based on selected criteria. Slicers make dashboards more user-friendly, intuitive, and customizable—especially when working with large datasets or multi-dimensional reports.

Types of Power BI Slicer Styles

Power BI provides different slicer styles to help users filter data in the most intuitive and efficient way based on the type of field—whether it is text, numbers, or dates. Below is a description of each slicer style from your screenshot:

Slicer Type	Best For	Example
Vertical List	Categories	Country, Segment
Tile	Visual category buttons	KPIs, Segments
Between	Range selection	Date range, Profit range
Before	Upper limit	Before April 2023
After	Lower limit	After RM 10,000 revenue
Dropdown	Compact category filtering	Long lists
Relative Date	Rolling date filters	Last 7 days
Relative Time	Real-time filtering	Last 30 mins

Line Chart

- Stable Sales with a Major October Spike:**

Sales stay between \$5M–\$10M from January to September, followed by a sharp rise to **\$23.4M in October**, then adjust to **\$12.7M in November** and **\$17.4M in December**.

- Profit Peaks Align with Sales Peaks:**

Profit remains low for most months (<\$1M) but reaches its highest value of **\$3.4M in October**, with moderate profits in **September (1.8M)** and **December (2.7M)**.

- **Seasonal High-Performance Months:**

October stands out due to holiday/festival demand, marketing activities, or promotions, making it the strongest month for both sales and profit.

- **Year-End Growth Trend:**

Both sales and profit show a noticeable upward movement in **Q4**, highlighting strong year-end buying behaviour and increased customer demand.
