Conditional formatting:

Conditional formatting in Power BI is a feature that allows users to dynamically change the appearance of data in reports based on specific conditions or rules, enhancing data visualization and interpretation.

Steps:

- Go to **Visualizations** → **Scatter chart**
- Drag fields:
 - **X-Axis** → *Generosity*
 - **Y-Axis** → *Social support*
 - **Details** → *Country* (optional, to show dots individually)
 - **Legend** → *Cluster/Category* (to colour dots like red/green/blue)
 - **Size** → you can leave blank, or use a metric like *Happiness score*
- Go to **Format visual**
- **Title:** "Generosity and Social Support"
- **X-axis & Y-axis titles:** Add labels
- **Gridlines:** Turn on (light grey)
- **Colours:** Assign different colours for each cluster
- **Border & Background:** Add soft colours for presentation

Insights

- Most countries have **low generosity** but still show **high social support**, indicating strong community networks.
- A mid-range generosity group maintains **consistently high social support**, forming a clear cluster.
- Countries with **high generosity** show **mixed support levels**, meaning generosity alone doesn't determine social support strength.
